

WindForce® System

Revolutionary

Holtkamper trailer tents can now be erected and packed away by air pressure. This new “WindForce® System” is certainly a milestone in the development of trailer tents.

The rain remains outside

During the process of erecting or packing away the tent, no water is able to enter the tent and the remote control can be operated from inside the car. Thanks to the advanced engineering this can be achieved without the use of poles or guy ropes.

Even pegs are not required for an overnight camping. Tent and groundsheet will be unfolded and located at the right spot, without a wrinkle. Packing away the tent, complete with groundsheet, is also done with the a push of a button.

A “one person job”

Maybe you are a one parent family, or a person with physical limitations?

With the “WindForce® System” one person is able to perform the job easily. Families, with young children, can now spend time on the children, rather than erecting the tent.

A Holtkamper trailer tent with the “WindForce® System” can be erected (or packed away) in only a few minutes! Ideal for a quick weekend camping trip.

Future oriented technology

A quantum leap in the development of trailer tents. The Holtkamper “WindForce®” is a revolutionary system, our trailer tents can now be erected and packed away by air pressure. Within a couple of minutes, the groundsheet and the tent are unfolded and located on the right spot.

For generations of trailer tent owners, this long desired self erecting system, has now been implemented. This new “WindForce® System” is certainly a milestone in the development of trailer tents and has been protected by international patents.

Planning to move frequently from campsite to campsite? With the “WindForce® System” this is an (almost) effortless process. Only air pressure and vacuum, day-to-day physics, have been used to perform the job.

The Holtkamper Membrane Airco System, which supports insulation and ventilation, (located in the roof of the tent), will be erected and packed away together with the tent.

This new Holtkamper “WindForce® System” is different from the system used in “Igloo” tents, where air tubes are used in combination with high air pressure. This system, originating from France, has been imported to the Netherlands, some 35 years ago by Holtkamper.

Kyte - Technical Specifications

- Kerb weight approx. 550 kg
- Extra luggage approx. 200 kg
- Maximum permissible weight 750 kg
- Mattress approx. 210 x 155 cm
- Luggage space under the bed + in kitchen approx. 1,500 litres
- Surface area - with awning approx. 26m²
- Chassis - Galvanized Al-Ko chassis with mechanical brake system
- Trailer approx. L 400cm (incl. A-frame) x W 185cm x H 120cm
- Stainless steel and carbon fibre framework
- Kitchen built into trailer body.

Kyte

Pole-free Awning

The Kyte's pole-free awning is exclusive to Holtkamper and you won't find anything similar on any other trailer tent in the world. The awning 'floats' above the ground with no need for loose upright poles for support, thus giving you the use of all the available space inside.

The pole-free awning runs seamlessly into the roof extensions which have been especially designed for the Kyte. There are no loose poles for these, they simply fold in and out on a hinged frame. These roof extensions have a variety of purposes. Firstly, they shield the windows and side walls from direct sunlight and rain and secondly, they prevent the side walls from getting too dirty as rain doesn't run down the walls. This is beneficial as dirt combined with moisture is the biggest cause of mould forming in tent fabric. However, the roof of the Kyte really excels itself with the Holtkamper Membrane Airco Tent System.

Membrane Airco Tentsystem

The Holtkamper Membrane Airco Tent System is a worldwide patented system for ventilation, insulation and the prevention of condensation. The roof is actually made from two layers of material and this is how the system works. In normal or cold weather conditions you leave the two layers zipped together and the system works automatically. The 'climate chamber' between the two layers works to prevent condensation in rainy conditions and to provide insulation in cold conditions. In hot weather you unzip and separate the layers using a few small poles. This causes several effects. The hot air inside the tent rises up through the first roof layer and is blown away by the wind, whilst at the same time the upper roof layer is creating a shadow over the inner roof which prevents the sun from further heating the air inside the trailer tent, leaving you with a cool and comfortable living environment.

Sleeping in the Kyte

The Kyte is suitable for any size family; whether there are two or five of you the Kyte can be tailored to suit your needs. Inside there is a large double bed with a slatted base for comfort and to allow air to circulate to prevent condensation. To further prevent condensation the bedroom area also has windows that can be opened and a huge ventilation wall with mosquito netting. There is then the option to fit an extension that provides you with another two - three berth sleeping room with the optional space for a wardrobe or toilet.

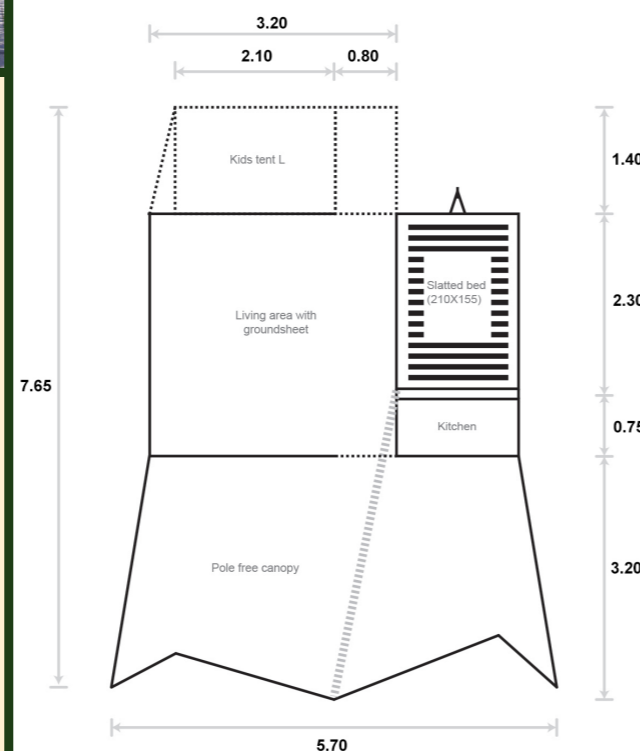

Storage

Storage is no issue in the Kyte; in fact the entire body of the trailer is storage space

for all of your belongings. By lifting up the bed base you gain access to the massive 1500 litre luggage space underneath and there is a further 250l of storage space under the soft top when the trailer tent is folded away. The Kyte also features the Holtkamper Pack-N-Go System. This means that when the trailer tent is folded away the storage space under the bed can still be accessed.

The Kyte Kitchen

The kitchen supplied with the Kyte is built into the body of the trailer and fixed in place so there is no lifting or difficult manoeuvring into place before use. The kitchen unit itself is beautiful and fantastically equipped; it features a 3 burner, gas hob with a stylish glass plate, a practical (optional) water supply and a fridge. Furthermore the Kyte kitchen features two spacious shelves, fitted with plastic boxes, for storage and there are two large flaps that lift to reveal a large 'kitchen hold' where you can store everything to hand. The awning panel at the side of the kitchen can also be removed if necessary so that you always have a comfortable climate for cooking in.

Cocoon Aero - Technical Specifications

- Kerb weight approx. 300 kg
- Extra luggage approx. 450 kg
- Maximum permissible weight 750 kg
- Mattress approx. 210 x 155 cm
- Luggage space under the bed approx. 1000 litres
- Surface area - with awning approx. 23m²
- Chassis - Galvanized Al-Ko chassis with mechanical brake system
- Trailer approx. L 320cm (incl. A-frame) x W 185cm x H 120cm
- Stainless steel and carbon fibre framework
- Choice of optional kitchen units

Cocoon Aero

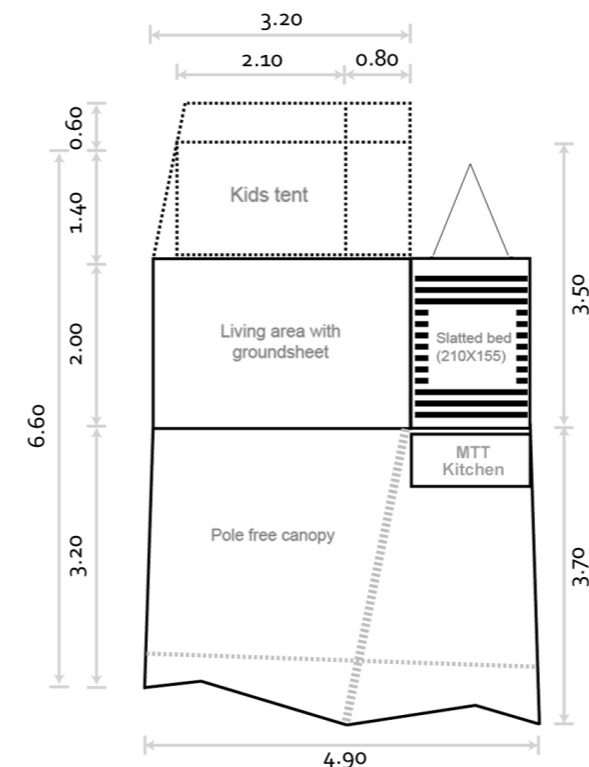

Best of Both

The Cocoon Aero is an amalgamation of two very popular models, the Cocoon and the Kyte. It can be put up in 20 minutes because of its very simple frame system and it also features the very popular canopy/awning taken from the Holtkamper Kyte.

Visually, the Cocoon Aero is striking; fitted with the popular Kyte canopy, its high, arched openings give users the maximum contact with their surrounding environment.

Pole-free Awning

The canopy/awning is part of the one piece roof structure which makes for a quick and easy set up, this roof runs seamlessly into roof extensions which have been taken from the Kyte. These will firstly, shield the windows and side walls from direct sunlight and rain and secondly, prevent the side walls from getting too dirty as rain doesn't run down the walls. This is beneficial as dirt combined with moisture is the biggest cause of mould forming in tent fabric.

Membrane Airco

The Cocoon Aero is also equipped with the Membrane Airco System which creates a consistent and comfortable environment inside the trailer tent by using a double layered roof to keep the internal temperature regulated.

Sleeping in the Aero

The Cocoon Aero features a large double bed double bed with slatted base for comfort. In the bedroom area there are windows with mosquito netting that can be opened. There are range of modular extensions available, such as the children's adventure tent or Kids tent extensions with toilet compartment, this will sleep up to three more people, allowing you to tailor the unit to suit your specific needs.

Storage

Storage for all your equipment is no trouble, the trailer body is empty space to be used for your belongings. By lifting up the bed base you gain access to the massive 1000 litre lug-

gage space underneath. There is even further storage space underneath the soft top cover when the tent is folded away. The Aero also features the Holtkamper Pack-N-Go System. This means that when the trailer tent is folded away the storage space under the bed can still be accessed.

Kitchen Units

The Cocoon Aero has two kitchen unit options available; there is one unit which will secure to the A-frame of the trailer, the aluminium Base Kitchen, this can easily be wheeled around into position under the canopy.

The second option is for a fixed unit at the rear of the trailer, this would be a Kyte Masterclass kitchen. Both the kitchen units feature a 3 burner, gas hob with a stylish glass plate, a practical (optional) water supply and a fitted fridge.

Chassis

There are two different chassis options available for the Cocoon Aero, the standard chassis and the MTT chassis. The MTT is a longer chassis taken from the Kyte, it can be useful if you have a need to carry several push bikes, or if you would like to carry heavier E-bikes. The MTT chassis is also used for mounting Kyte Masterclass kitchen.

Both options are AL-KO braked chassis, with shock absorbers and 14" wheels to ensure a safe and stable towing experience. There are heavy duty wind down steadies to support the trailer when being used and for those who are a little more adventurous, it is possible to have an off-road edition which comes with larger wheels for extra ground clearance, this is particularly suited for use with off road vehicles.
